

# **HUMAN HEALTH AND DISEASE**

### **HEALTH**

 As per 'Good humor' hypothesis arrived at by reflective thought and asserted by Hippocrates along with Indian Ayurveda System.

**Health** is a state of body and mind where there was a balance of certain 'humors' e.g., persons with black bile belonged to hot personality and had fevers.

William Harvey (discovered blood circulation experimentally)
disproved this 'good humor' hypothesis of health by demonstrating
normal body temperature in persons with black bile using
thermometer. View of biologists in later years:

Mind influences our immune system through neural and endocrine systems, and that our immune system maintains our health i.e., state of complete physical, mental and social and psychological well being.

4

Health is not simply 'absence of disease' or 'physical fitness'.

• Factors affecting health:

3

Mental state, genetic disorders, infections and life style (habits, rest and exercise)

• Healthy \_\_\_\_ Increase \_\_\_ Productivity, longevity

Bring economic prosperity

Decrease \_\_\_\_ Infant and maternal mortality

### DISEASE

It is state of the body when functioning of one or more organ/systems is adversely affected, characterized • By various signs and symptoms.

### Types of diseases

### **Parameters**

- Transmission from one person to another
- Example

# Non-infectious Infectious

Cancer

AIDS

• Pathogens: are disease causing organisms

 Most parasites arepathogens living in (or on) the host multiplyand interfere with normalvital activities resulting in morphological and functional damage.

 Gut pathogens can survive harsh pH & digestive enzymes.

Mode of transmission	Bacterial	Viral	Protozoan	Helminthic
Air (droplet/aerosol) or object borne (pens, knobs etc.)	Pneumonia, diphtheria	Common cold, Smallpox	-	-
Direct contact	Tetanus	Smallpox		
Contaminated food and water	Typhoid, dysentery	Polio	Amoebiasis	Ascariasis
Insect vector/vector borne	Plague	Chikungunya, Dengue	Malaria	Filariasis
Body fluids	Syphilis	AIDS	Trichomoniasis	

 Vector: Transmits disease from one organism to another e.g. female Aedes mosquito is the vector for dengue and chikungunya, while, Anopheles spreads malaria.

4

# **MEASURES FOR PREVENTING SPREAD OF INFECTIOUS DISEASES**

Parameters	Measures	
Personal Hygiene	<ul> <li>Keeping the body clean</li> <li>Consumption of clean drinking water, food, vegetables, fruits etc.</li> </ul>	
Public Hygiene	Proper disposal of waste and excreta Periodic cleaning and disinfection of water reservoirs, pools, cesspools and tanks. Decontamination of drinking water	
Avoid close contact	Contact with infected persons and belongings should be avoided.	
Control vectors and their breeding places	<ul> <li>Avoid stagnation of water in and around residential areas.</li> <li>Regular cleaning of house old coolers</li> <li>Use of mosquito nets</li> <li>Introducing larvicidal fishes like Gambusia in ponds that feed on mosquito larvae</li> <li>Spraying of insecticides in ditches, drainage areas and swamps</li> <li>Doors and windows should be provided with wire mesh.</li> </ul>	

 Balanced diet, yoga and regular exercise, personal hygiene, awareness about diseases and vaccination are very important to maintain good health.

 Use of vaccines and immunisation programmes have enabled us tocompletely eradicate a deadly diseaselike smallpox. Large number of infectious diseases like polio, diphtheria, pneumoniaand tetanus have been controlled to a large extent by the use of vaccines.

 Biotechnology is at the verge of making available newer and safer vaccines.

 Discovery of antibiotics and various drugs have enabled us to effectively treat infection

# **BACTERIAL DISEASES**

Disease	Pathogen	Organ affected	Common symptoms
• Typhoid	Salmonella typhi Diagnostic test: Widal test	Small intestine and other organs by migrating through blood	Sustained high fever (39-40°C) Stomach pain •Weakness Constipation •Headache Loss of appetite In severe cases, intestinal perforation and death may occur.
• Pneumonia	Streptococcus pneumoniae, Haemophilus influenzae	Alveoli of lungs	<ul> <li>Problem in respiration due to fluid filled alveol</li> <li>Fever, chills, cough, headache</li> <li>In severe cases, lips and finger nails turn gray to bluish</li> </ul>

Typhoid Mary (Mary Mallon), a cook by profession was a typhoid carrier who spread typhoid through the food she prepared.

### VIRAL DISEASES

Disease	Pathogen	Organ affected	Symptoms
• Common cold	Rhino virus	Nose and respiratory passage	Nasal congestion and discharge Sore throat Hoarseness, cough Headache, tiredness

Common cold does not infect lungs and its symptoms usually lasts for 3-7 days

### **HELMINTHIC DISEASES**

Disease	Pathogen	Organ/structure affected	Symptoms	
Ascariasis	Ascaris (Roundworm)	Intestine	<ul> <li>Internal bleeding, fever, muscular pain, anemia, blockage of intestinal passage</li> </ul>	
•Elephantiasis /Filariasis	Wuchereria bancrofti /W. malayi (Filarial worm)	Lymphatic vessels	Chronic inflammation of organs in which they live for many years resulting in gross deformities e.g., limbs, genital organs etc.	

### **FUNGAL DISEASE**

Disease	Pathogen	Body parts affected	Symptoms	
• Ringworm	Microsporum, Trichophyton, Epidermo- phyton	Skin, nails, scalp	<ul><li>Dry, scaly lesions</li><li>Intense itching</li></ul>	

- •
- Heat and moisture makes the fungi thrive in skin folds such as in groin and between toes
  - Acquired from soil or belongings of infected individuals such as towels, combs, clothes etc.

Disease	Pathogen	Area affected	Symptoms
Amoebiasis /Amoebic dysentery	Entamoeba histolytica	Large Intesting	<ul><li>Constipation</li><li>Abdominal pain</li><li>Cramps</li><li>Stool with excess mucous and blood clots</li></ul>
• Malaria	<ul><li>Plasmodium</li><li>P. vivax</li><li>P. malariae</li><li>P. falciparum</li></ul>	RBCs	<ul><li>Chills</li><li>High fever recurring every 3-4 days</li><li>If not treated, can prove to be fatal</li></ul>

- House flies act as mechanical carrier for amoebiasis
- P. falciparum causes malignant malaria (Most serious form)

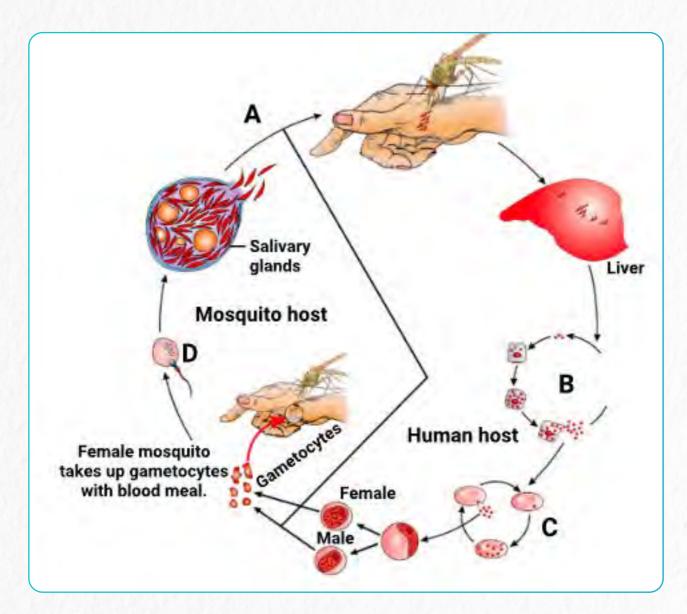

Fig: Stages in the life cycle of Plasmodium

# 7

# AIDS/ACQUIRED IMMUNO DEFICIENCY SYNDROME

• 1st reported - 1981, Killed - Approximately 25 million people in last 25 years

 It is deficiency of immune system, acquired during the lifetime of an individual

• **Syndrome** means 'group of symptoms'

Non congenital, fatal infectious disease

• Causative agent – HIV / Human Immuno deficiency virus Enveloped virus enclosing RNA genome • Life cycle **Mode of Transmission High Risk Individuals** Multiple sexual partners Sexual contact Entry of virus in body-Placenta Mother to foetus Repeated blood transfusion, -Blood transfusion Linfected needles Drug addicts (intra venous) Entry into body cells (Macrophages, helper T-cells) Plasma Viral protein membrane coat Animal cell Viral RNA is introduced into cell Cytoplasm Viral DNA is produced by reverse Viral DNA incorporates into host genome transcriptase New viral RNA is produced by the infected cell New viruses are produced Nucleus New viruses can infect other cells

### Sequence of events:

03

There is progressive

decrease in number

of helper T-cells

Inflected cells,
(Macrophages) can
survive while viruses
are being replicated and

released hence called

**HIV factory** 

01

HIV enters into macrophages and T-helper cells (T<sub>H</sub>)

simultaneously

02

Initial symptoms:
Bouts of fever, diarrhoea,
weight loss

04

05

Later the immuno-deficient patient is prone to infections especially Mycobacterium, viruses, fungi, Toxoplasma etc.

There is always a time-lag between infection and appearance of AIDS symptoms. This may vary from a few months to many years (usually 5-10 years)

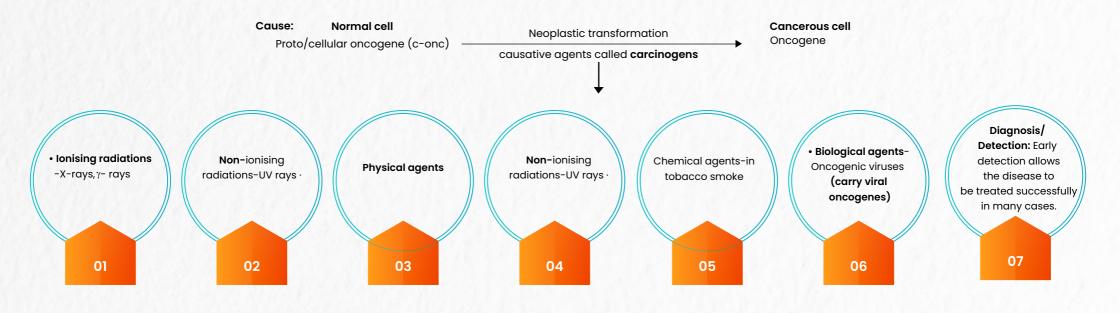

# 8 CANCER

• A dreaded non-infectious disease; major cause of death all across the globe.

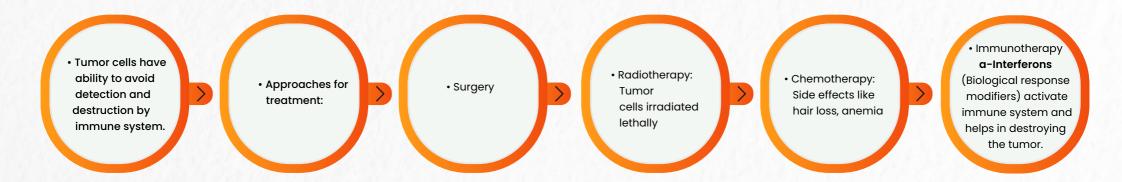

Parameters	Normal cells	Cancerous cells/Neoplastic cells
Cell growth and differentiation	Highly controlled and regulated.	Uncontrolled & non-regulated.
Contact inhibition	<b>Present</b> , virtue of which contact with other cells inhibits their growth.	<b>Lost,</b> so these cells keep on dividing and form mass of cells called Tumor/Neoplasm.

#### **Types of Tumor**

Parameters	Benign	Malignant tumor/cancer
Cell growth and differentiation	Confined to original place	Grow rapidly and spread to other parts.
Contact inhibition	Little damage	Invade and damage other cells starving normal cells by competing for vital nutrients.
Metastasis	No	Yes, Cells sloughed from such tumors reach distant sites through blood and start new tumo called Metastasis (Most feared property).

Technique	Basis	Detect
Biopsy	Histopathological studies	Changes in tissue
Blood and bone marrow test	Cell counts	Leukemias
Radiography	X-rays	Internal organ cancers
Computed tomography (CT)	X-rays	Internal organ cancers (3D image)
Magnetic resonance Imaging (MRI)	Strong magnetic fields and non-ionising radiations	Accurately detect pathological and physiological changes in living tissu
Molecular techniques Antibodies based	Identification of genes responsible for susceptibility to certain cancers Against cancer specific antigens	Certain cancers

9 IMMUNITY

• The ability of the host to fight the disease causing organisms, conferred by the immune system is called Immunity

Parameters
Observed from
Exposure to infection
Defence
Memory record

Innate
Time of birth
Not required
Non specific

x

Types

Acquired
After birth
Required
Specific

✓

Memory based immunity evolved in higher vertebrates

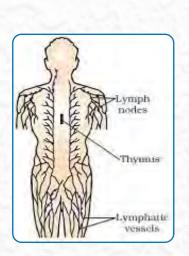

• This immunity is accomplished by providing different types of barriers to the entry of the foreign agents.

Types of Barrier	Structures involved/Barrier	Basic function
Physical	<ul> <li>Skin</li> <li>Mucus coating of the epithelium lining the respiratory, gastrointestinal and urogenital tracts</li> </ul>	<ul><li>Prevent entry of microbes.</li><li>Trap microbes entering our body.</li></ul>
Physiological	Saliva in the mouth •Acid in stomach     Tears from eyes	• Prevent microbial growth.
Cellular	Neutrophils/PMNL •Monocytes     Macrophages •Natural killer cells (type of lymphocytes)	<ul><li>Phagocytose microbes.</li><li>Destroy microbes.</li></ul>
Cytokine	• Interferons	Produced by virus infected cells that protect non-infected cells from further infection.

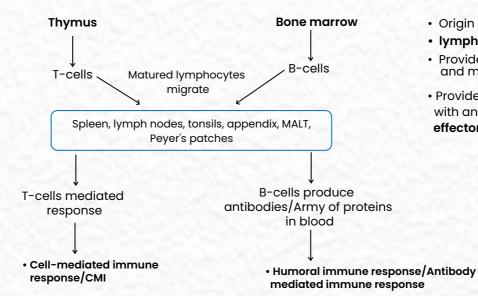

11 ACQUIRED IMMUNITY

The human immune system consists of lymphoid organs, tissues, cells and soluble molecules like antibodies. This response is carried out by two special types of lymphocytes present in our blood i.e., **B and T-lymphocytes**.

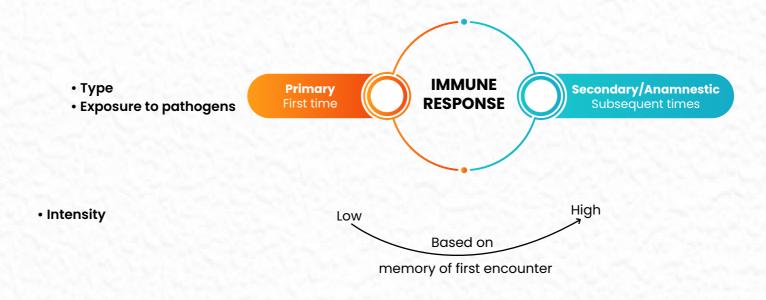

Primary lymphoid organs

Secondary lymphoid organs

- Origin and/or maturation of lymphocytes
- lymphocytes become antigen sensitive
- Provide micro-environments for development and maturation of lymphocytes
- Provide sites for interaction of lymphocytes with antigen which proliferate to become effector cells.

These responses are carried out by B and T-lymphocytes.

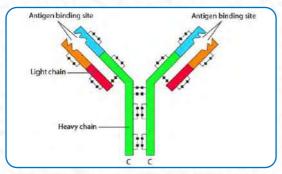

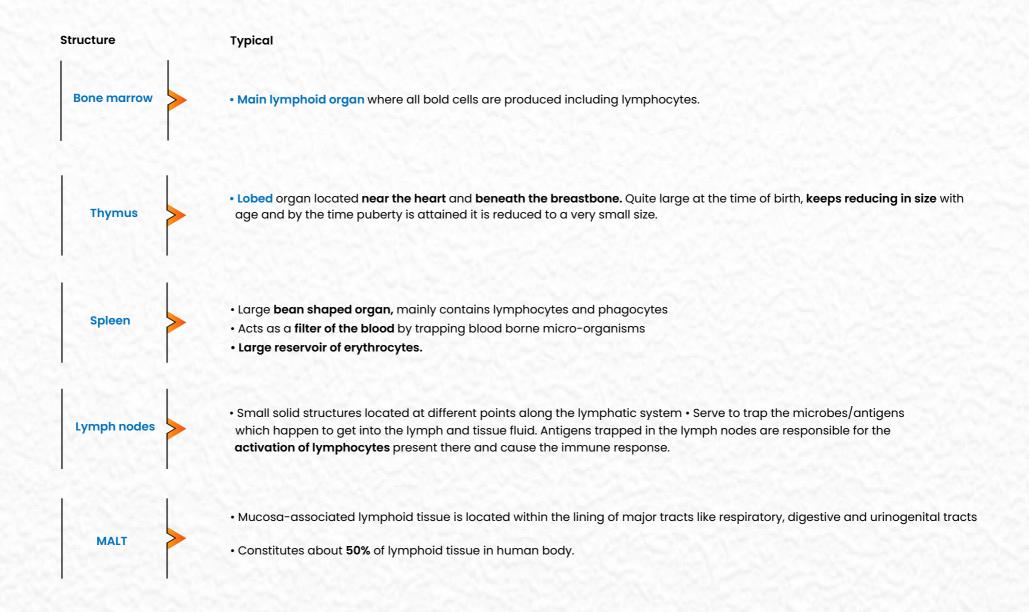

Fig: Structure Of An Antibody Molecule

- Each antibody has 4 peptide chains (H<sub>2</sub>L<sub>2</sub>)
- 2 long heavy chains
- 2 short light chains
- Called immunoglobulins (Ig)
- Types IgA, IgM, IgE, IgG

• T-lymphocytes are responsible for graft rejection. Tissue and blood group matching are essential before undertaking any graft/transplant and even after this patient has to take immunosuppressants throughout life.

• If the pathogens succeed in gaining entry to our body, specific antibodies and T-cells serve to kill these pathogens.

12 LYMPHOID STRUCTURES/ORGANS

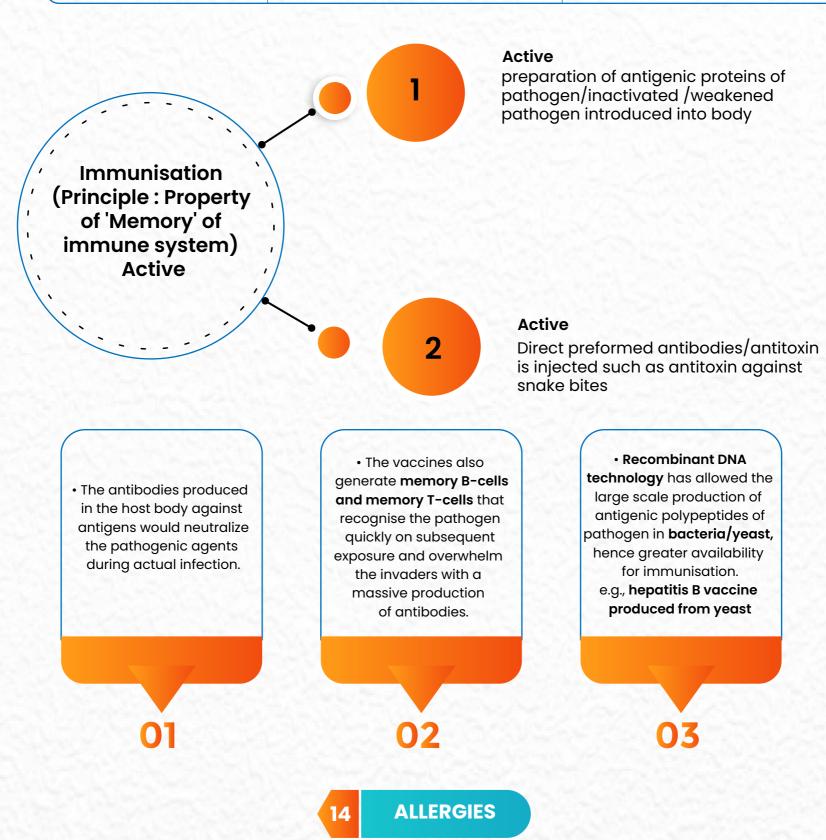

13 VACCINATION AND IMMUNISATION

### Types of immunity

Antibodies	Active Produced within the host body	Passive Ready-made/preformed antibodies are directly given
Time taken for full /effective	Longer	Shorter
Memory cells	✓	×
Examples	Natural infection  Antibody production in host  Vaccination  Deliberate injection of living/dead microbes/proteins	<ul> <li>Mother          Placenta           → Foetus     </li> <li>Mother Colostrum           (IgA)           Infant</li> </ul>

**Exaggerated response** of immune system to certain antigens present in the environment.

**Allergens** – Substances to which exaggerated immune response is produced e.g. pollens, mites in dust, animal dander, etc.

### Antibodies - IgE type

Symptoms - Sneezing, watery eyes, running nose, difficulty in breathing.

Chemical released – Histamine and serotonin from mast cells.

**Diagnosis** – Patient is exposed to or injected with very small doses of possible allergens, and reactions studied.

**Treatment** – Anti-histamine antihistamine, adrenaline and steroids quickly reduce the symptoms of allergy.

# Effects of modern-day life style

- More and more children in metro cities of India suffer from allergies and asthma due to more sensitivity to the environment.
- Protected environment provided early in life has resulted in lowering of immunity and person is more sensitive to allergens.

• Memory based acquired immunity evolved in higher vertebrates can **distinguish foreign** molecules as well as foreign organisms (pathogens) **from self-cells.** 

Results – Self
destruction
/body
attack self cells

Reason – Genetic /unknown

Example – Rheumatoid arthritis

16

**DRUG ABUSE** 

- Chemical when taken for a purpose other than medicinal use or in amounts/ frequency impairs one's physical, physiological or psychological functions and constitutes drug abuse.
- Source Majorly from flowering plants and some from fungi.
- Commonly abused drugs are:

Drug	Receptors	Source	Intake	Examples	Action and anything specific
Opioids	CNS, GIT	Latex of poppy plant, Papaver somniferum	Snorting, injection	Morphine     Heroin/Smack     (Diacetylmorphine)	<ul> <li>Effective sedative and pain killer</li> <li>Useful in patients undergone Surgery</li> <li>Depressant and slows down body functions</li> <li>Odourless, white, bitter crystalline compound</li> </ul>
Cannabinoids	Principally in brain	Opium poppy  Inflorescence, flower tops, leaves and resin of cannabis plant, Cannabis sativa	Inhalation, oral ingestion  Skeletal structure of cannal	Charas Hashish Ganja Marijuana  binoid molecule	<ul> <li>Produced by virus infected cells that protect non-infected cells from further infection</li> <li>Effects on cardiovascular system of the body</li> <li>These days cannabinoids are formating also being abused by some sportspersons</li> </ul>
Stimulants	CNS	Leaves of Cannabis sativa  Coca plant Erythroxylum coca (Native of South America	Snorting	Cocaine/coka alkaloid     Commonly called     (coke/crack)	Interferes with transport of neurotransmitter dopamine     Potent stimulating action on CNS, producing sense of euphoria and increased energy     Excessive dosage causes hallucinations
Hallucinogens		Atropa belladona, Datura			Have been used for hundreds of years in folk-medicine, religious ceremonies and rituals all over the globe.
Other drugs		Synthetic	Flowering branch of Datura	Barbiturates, Benzodiazepines, Amphetamines	Help patients cope with mental illness like depression insomnia.

# **DRUGS AND SPORTSPERSON**

### Why to use?

- Increase muscle strength & bulk.
- Promote aggressiveness.
- Enhance athletic performance.

### Commonly abused drugs

- · Narcotic analgesics.
- · Diuretics.
- · Anabolic steroids.
- · Certain hormones.

#### Common side effects

- Increased aggressiveness.
- Mood swings. · Depression.
- Stunted growth because of premature closure of growth centres of long bones.
- Severe facial and body acne.

### Typical side effects

#### Male

- Breast enlargement
- Decreased sperm production
- · Reduction in size of testicles
- Acne, premature baldness, enlargement of prostate gland
- Potential for liver and kidney dysfunction

- Masculinisation (features like males)
- · Abnormal menstrual cycles
- · Enlargement of clitoris
- Excessive hair growth on face & body
- Deepening of voice

### • These side effects may be permanent with prolonged use.

TABACCO/SMOKING-PAVES THE WAY TO HARD DRUGS

01

- Intake
- Smoked
- Snuff

Chewed

02

- Chemical substance
- Nicotine, an alkaloid.

03

- Action of nicotine
- Stimulates adrenal gland to release adrenaline and non-adrenaline into blood circulation.

04

### **Effects**

- Respiratory system
- Increases carbon monoxide (CO) in blood and reduces concentration of haembound oxygen, causes oxygen deficiency in the body.

05

- Circulatory system
- Increase heart rate and blood pressure.

06

- Common diseases
- · Bronchitis.
- Emphysema.
- Coronary heart disease.
- · Gastric ulcer.

07

- Risk of cancers
- Oral cavity.
- Throat. • Lungs.
- Urinary bladder.

• Tobacco has been used by humans for more than 400 years • Packets of cigarettes, warns against smoking and says how it is injurious to health.

ADOLESCENCE AND DRUG/ALCOHOL ABUSE

 Adolescence means both "a period" and process" during "a which a child mature in terms of his/her attitudes and beliefs for effective participation in society.

2

• Adolescence is a bridge linking childhood and adulthood.

3

• It's a period between 12-18 years of age, a vulnerable phase of mental and psychological development of an individual.

4

• it is accompanied by several biological and behavioural changes.

5

· Curiosity, need for adventure and excitement, and experimentation, motivate youngsters towards drug and alcohol use

6

· First use may be out of curiosity but later used to escape from stress, pressures to excel in academics, perception that it is cool.

· Television, movies, newspapers, internet, promote this perception.

8

 Unstable or unsupportive family structures and peer pressure also promote drug and alcohol abuse.

# 20 ADDICTION AND DEPENDENCE

### Addiction

• Because of perceived benefits, drugs are frequently used repeatedly that leads to **psychological attachment to certain effects** like euphoria and temporary feeling of well being

### Dependence

It is the tendency of the body to manifest a characteristic and unpleasant "withdrawal syndrome" if regular dose of drugs/alcohol is abruptly discontinues. Addiction drive people to take drug even when its use become self-destructive

- With repeated use of drug, tolerance level of receptors increases
- Receptors respond only to higher doses of drugs leading to greater intake.

### Effects of drug/alcohol abuse

• Reckless behavior. • Vandalism • Violence • Depression • Fatigue • Drop in academic performance

### Warning signs

- Unexplained absence from school/college
- Aggressive and rebellious behaviour
- Change in sleeping and eating habits
- Deteriorating relationships with family and friends
- Poor personal hygiene, withdrawal, isolation
- Loss of interest in hobbies
- Fluctuations in weight and appetite

- High doses lead to coma and death due to respiratory failure, heart failure or cerebral hemorrhage
- Chronic use of drugs/alcohol damage nervous system and liver (cirrhosis)
- Use of drugs during pregnancy adversely affect foetus. Some far-reaching implications
- Abuser may turn to stealing
- Addict becomes the cause of mental and financial distress to entire family and friends

### Withdrawl syndrome

If drug is abruptly discontinued, symptoms include:

- Anxiety Nausea Shakiness Sweating
- In severe cases, can be life threatening, person needs a medical supervision.

### Prevention and control 'Prevention is better than cure"

- Avoid undue peer pressure on child related to sudies, sports or other activities
- Education and counselling: Channelise energy of child into healthy pursuits like sports, yoga, reading, music, etc.
- Sort out problems by seeking help from parents and peers.
- Looking for danger signs: Alert parents, teachers and close friends need to look for and identify the danger signs of substance (drug/alcohol) abuse and appropriate measures would then be required to diagnose the malady and underlying cause.
- Proper remedial steps or treatment should be taken by seeking professional and medical help in the form of highly qualified psychologists, psychiatrists and de-addiction and rehabilitation programmes. This will totally relieve the individual from these evils.
